

Cyber-Security Measures for ICS focusing on Safety

Yoshihiro Hashimoto and Ichiro Koshijima
Nagoya Institute of Technology, Japan

<http://www.manage.nitech.ac.jp/Security/>

Every Industrial Plant has Cyber Threats

Stuxnet (Epoch making Malware discovered in 2010)

The first **cyber weapon** for **physical destruction** developed by **USA and Israel governments**

Target: PLC for centrifuges in **Iran's uranium enrichment plant**

Although its infection is spread via internet, P2P or USB, onset is limited to the target.

PLC was attacked even if **it was isolated from internet.**

Multiple zero-day (unpatched vulnerability) exploits are utilized, so, anti-virus software was useless.

Subspecies of Stuxnet (Variation Increasing)

Target: **Any type of Control System (not Limited for PLC)**

Energy , Water supply, Chemical Plant, Transportation, Building, etc.

Many incidents have already been reported.

Even heat control system of a swimming pool was attacked in E.U.

Characteristics: **Subspecies of Stuxnet can be developed by Pranksters, too.**

Plant Location is irrelevant for cyber attacks.

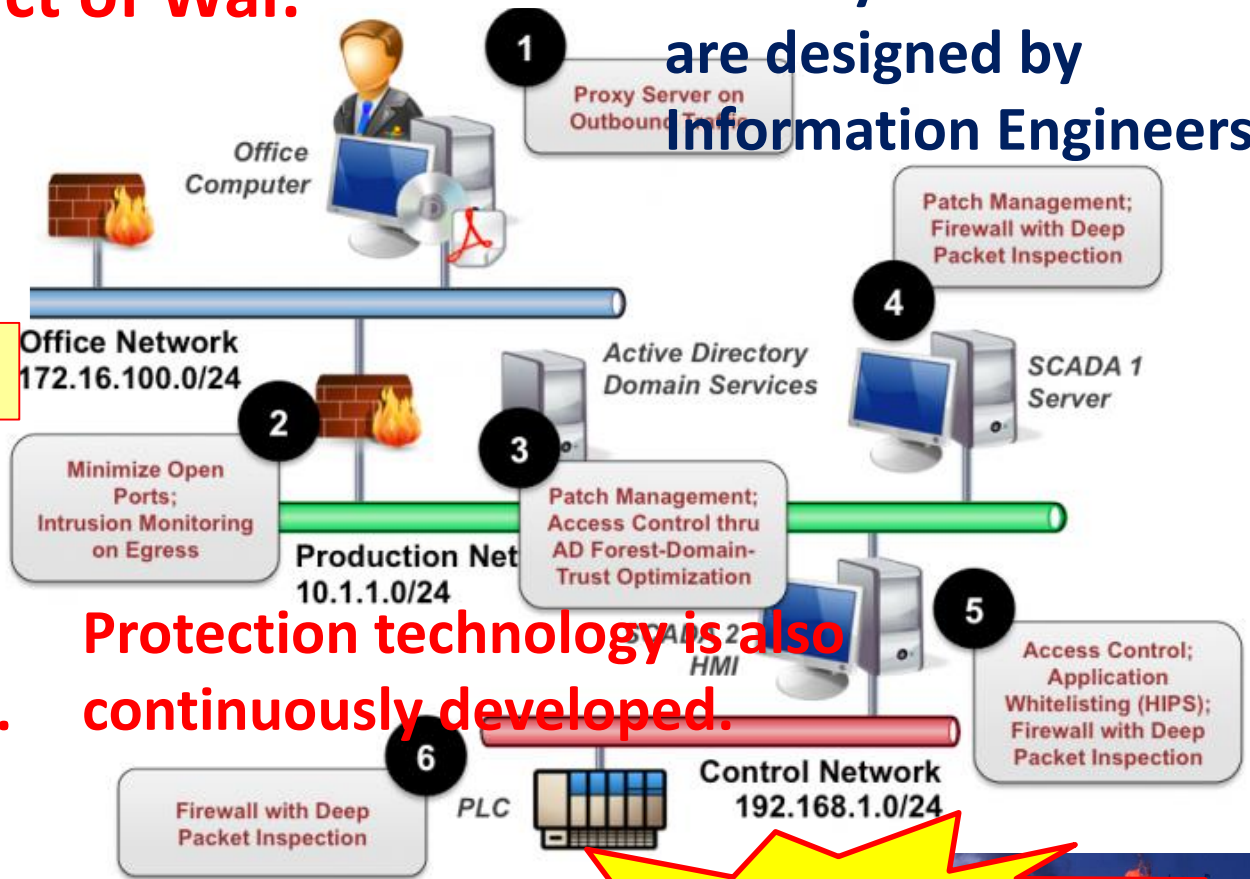

Havex (Malware to steal information from OPC server discovered in 2014)

Development of Cyber security technology becomes Vicious circle.

Cyber attack is an act of War.

Security measures are designed by Information Engineers

Attack technology is continuously developed.

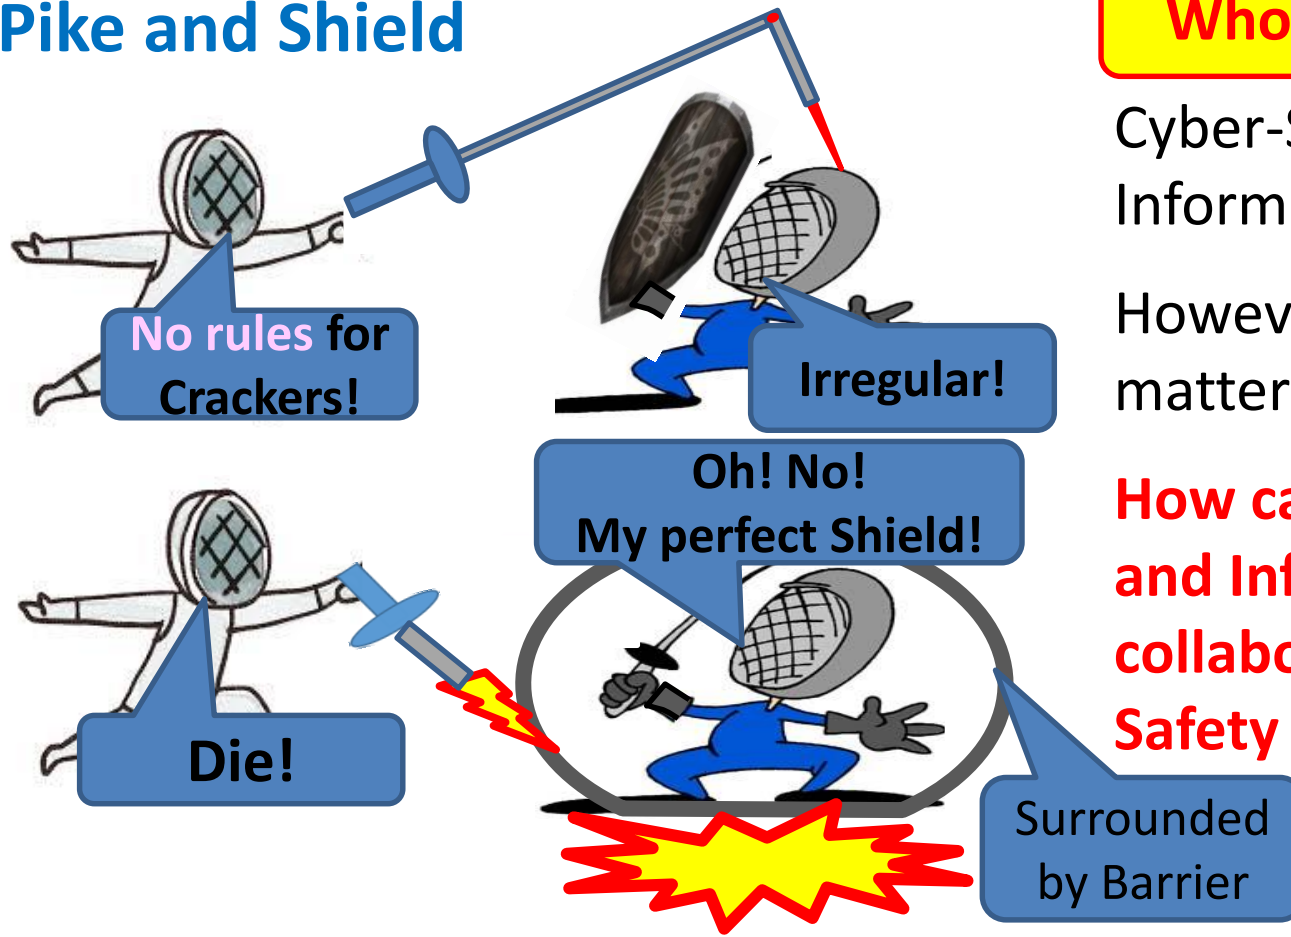

Protection technology is also continuously developed.

If **Serious Accidents** occurred by attacks using **Unknown Vulnerability**, do you say “There were **No Ways** to avoid it.” ?

Battle between Hackers and Protectors

Pike and Shield

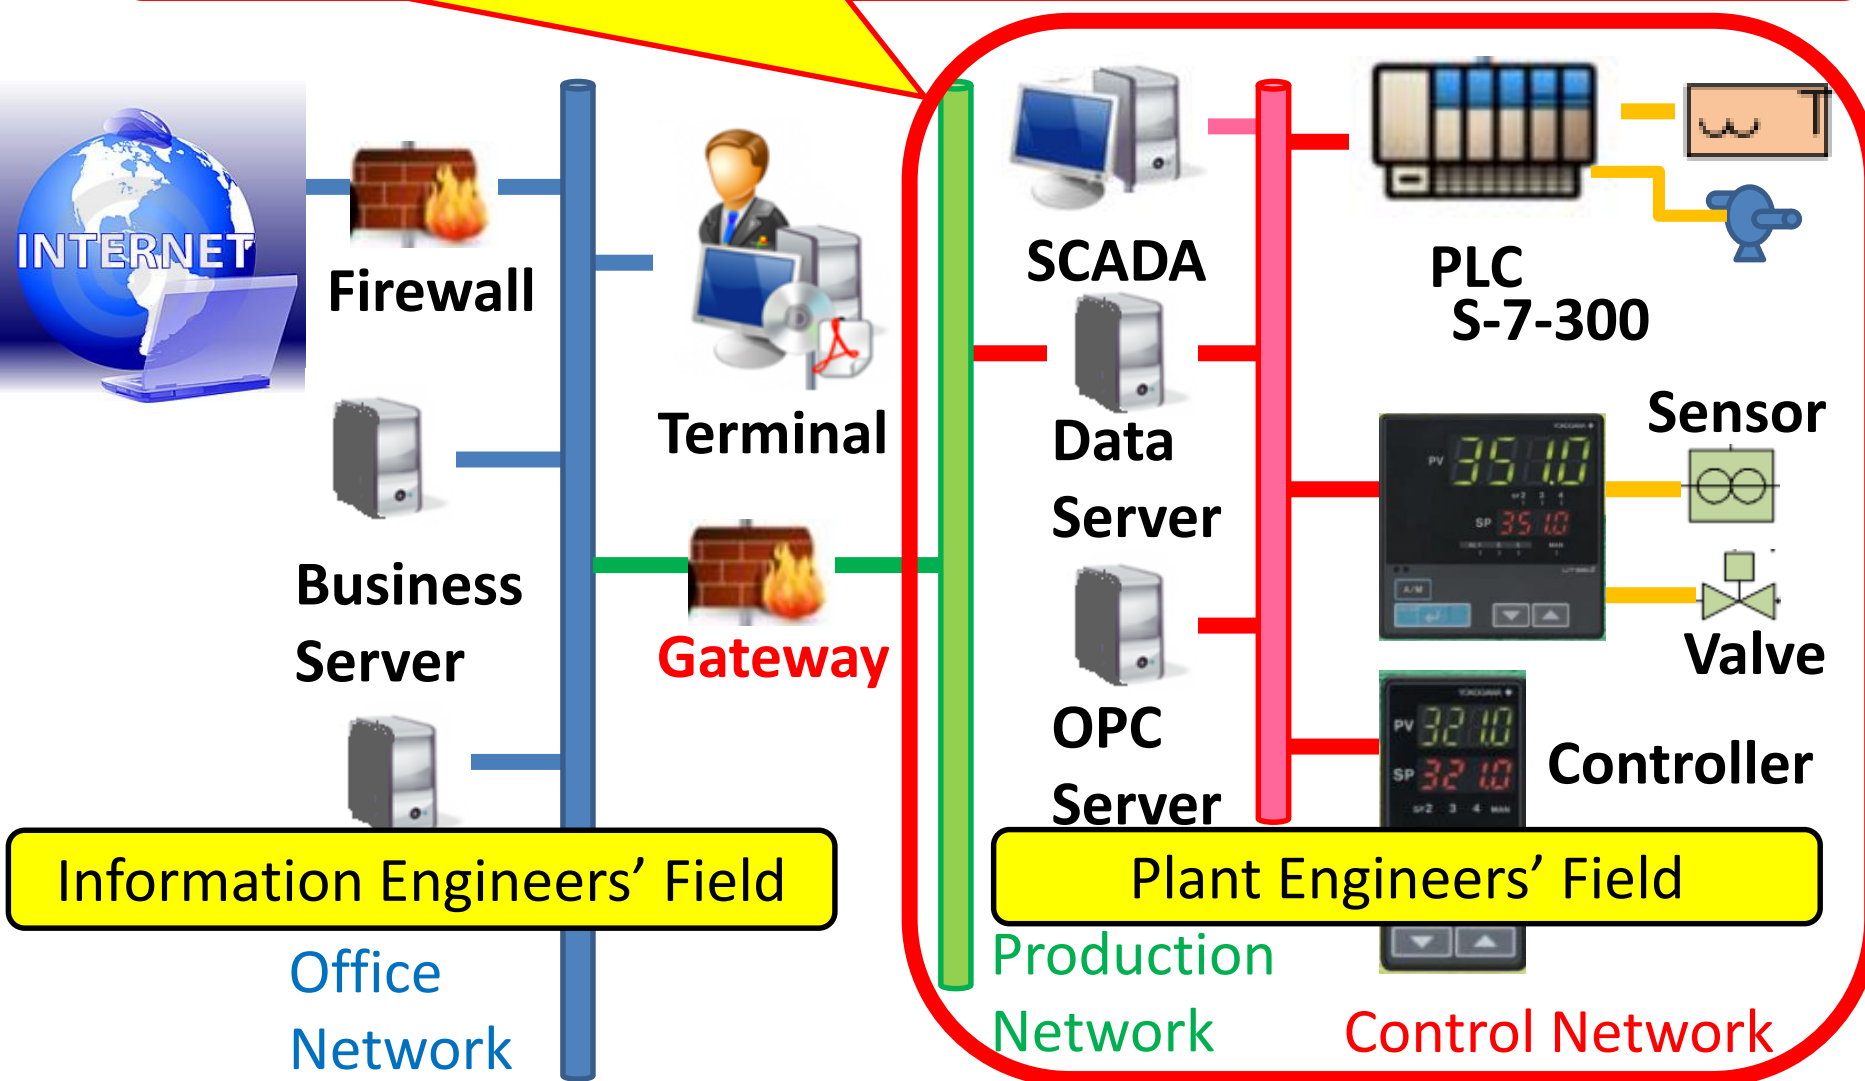

Cyber-Security is discussed by Information Engineers.

However, Safety was the matter of Plant Engineers.

How can Plant Engineers and Information Engineers collaborate to maintain Safety against cyber-attacks?

Security Measures Focusing on Safety

Maintain **Safety** even if the attacker used **unknown vulnerability!**
What kinds of measures can be applied to this field?

Cyber-Attacks can be regarded as “**Malicious Controller Failures and Malicious Miss-Operation**”

- Cyber-attackers can directly manipulate physical items only via controllers.
- If the information on the HMI of SCADA was tampered, Operators might cause Miss-Judge or Miss-Operation.

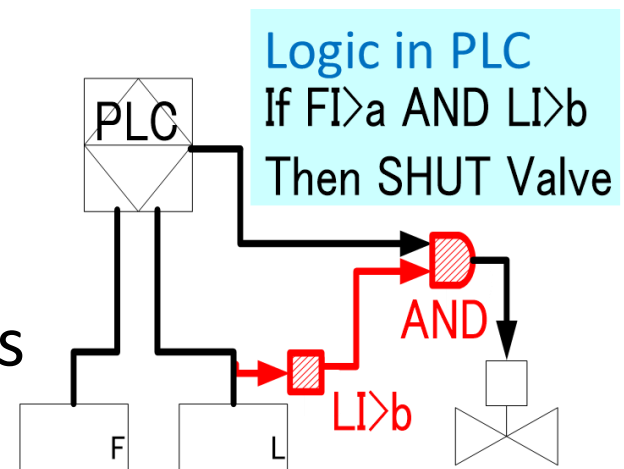

Measures against

Unknown types of Cyber-attacks

- 1) To adopt **Unintelligent** systems.

Analog communication and Relays

- 2) To design **Fail-Safe and Fool-Proof** thoroughly

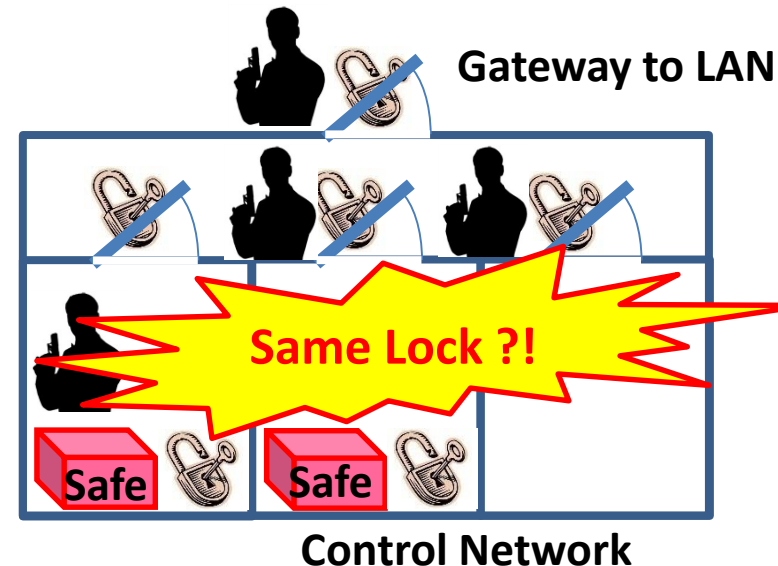

Analog Signal & Relays
don't suffer Cyber attacks.

Heterogeneous Multiplex Multilayer Measures

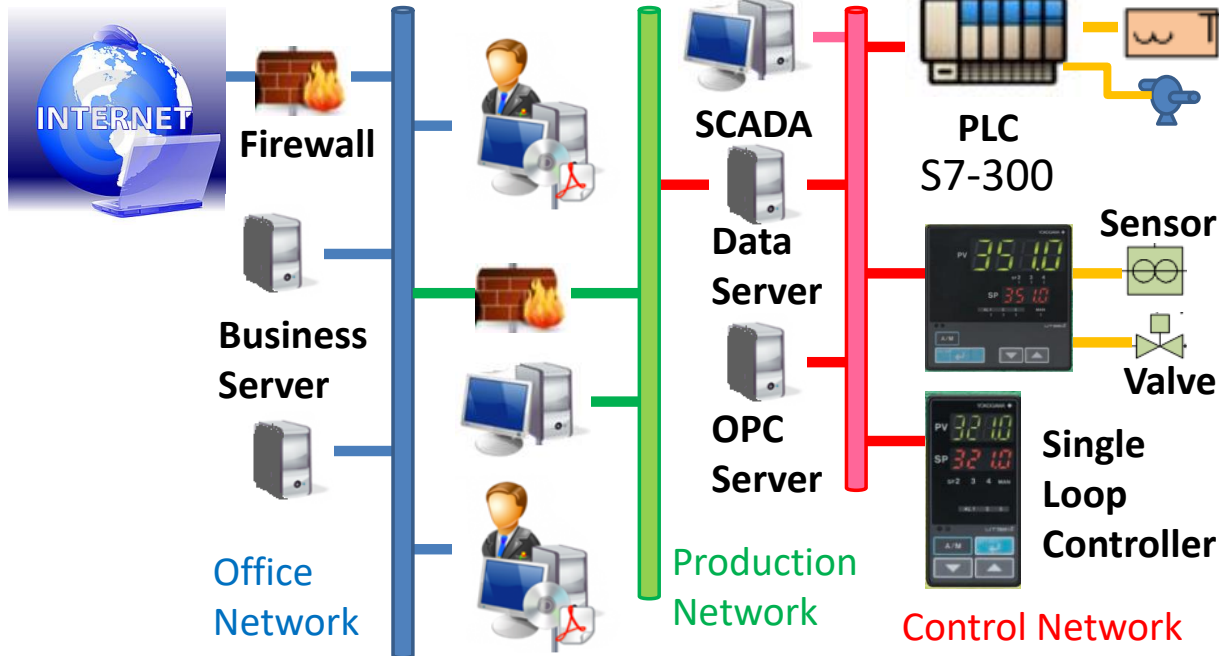

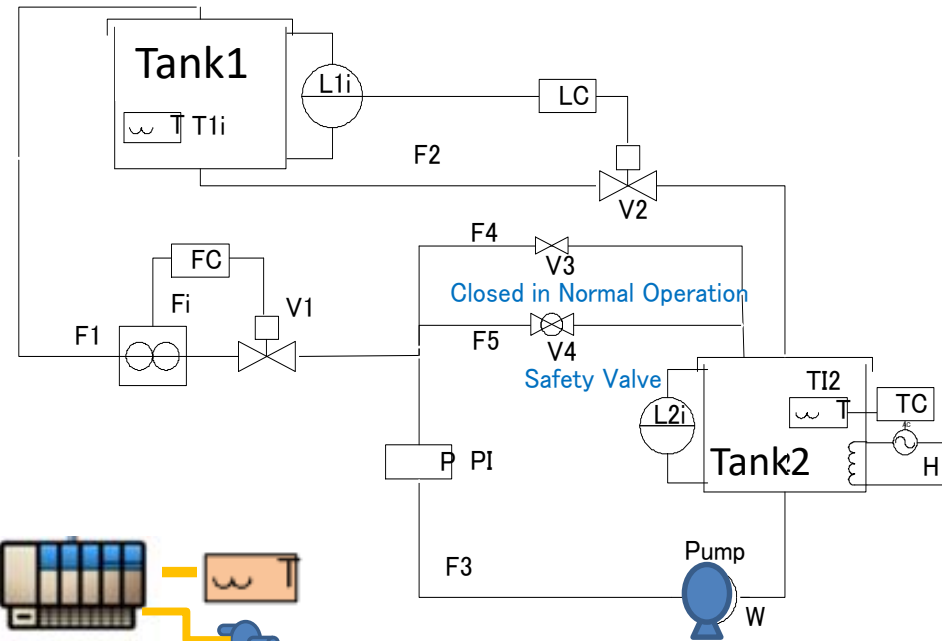

- In Safety Analysis, Single failure is usually assumed.
- Even if the same parts are utilized, the failure rate can be reduced to the 2nd power.
- In Cyber-attacks, **Multiple Multi-types attacks might occur at Multi-places Simultaneously.**
- Vulnerability might appear in application, protocol, operation system and so on **in future.**
- **Variation** is necessary in the Cyber-Security Measures.

**Before whole system loses control,
Detect attack and Maintain Safety!**

- **What** must be protected in the saves in Control Networks?

Test bed in Nagoya Inst. of Tech.

Yokogawa and Siemens Controllers are available.

Network structures can be modified.

Before whole system loses control, Detect attack and Maintain Safety!

Zone Division of Control Network

Controller Data are collected by **OPC-UA server** 1 and 2 in each zone.

OPC-UA server0 gathers the data.

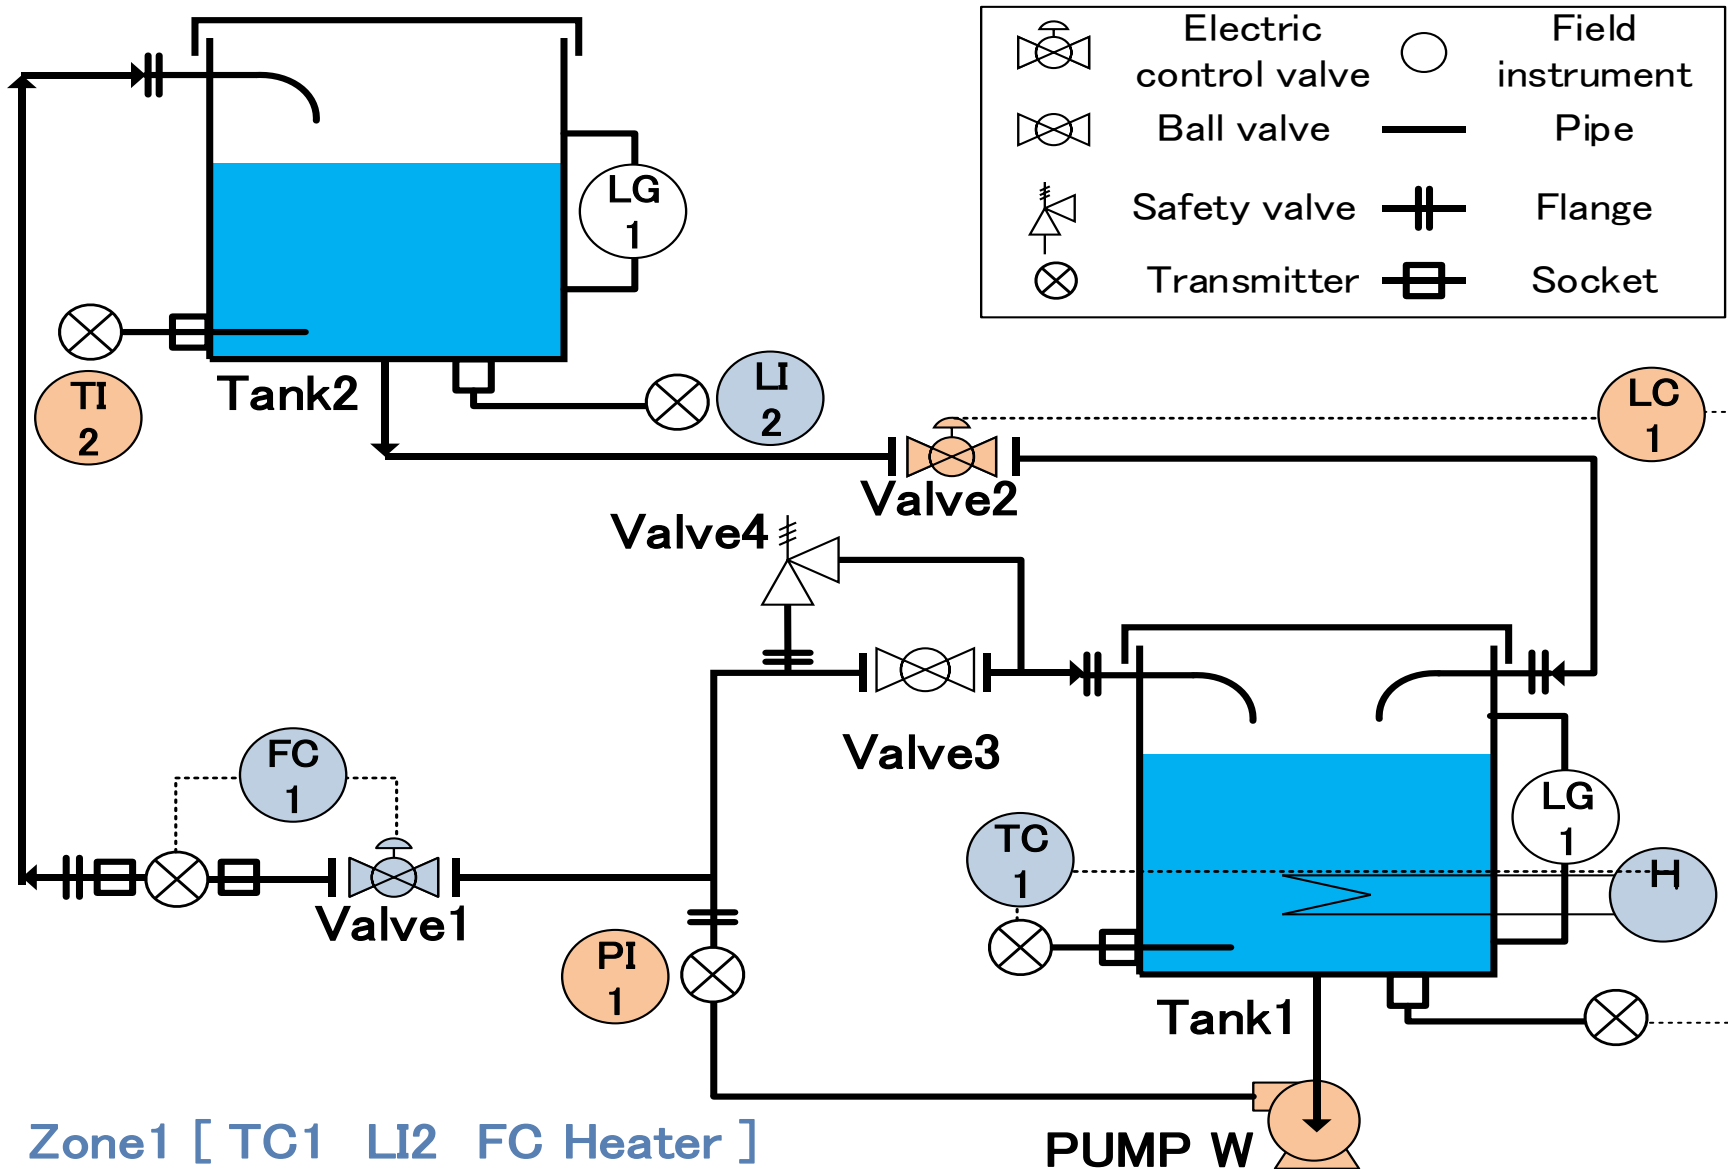

SCADA communicate with OPC-UA server0.

All of three OPC-UA servers Contains all tags and Communicate all data.

Zone division might be able to be executed in the instrument room.

Zone Division of Instruments

Zone1 [TC1 LI2 FC Heater]

Zone2 [LC1 TI2 PI Pump]

Design of Zone division

- Zone division for Cyber-Security must be discussed based on the properties of the Plant.
 - (1) Fault Trees of all serious accidents must be generated.
 - (2) Propagation of every malicious operation under concealment must be considered,
- For selection of Security tools (corresponding to Lock, Security camera, gate keeper, patrol and etc.) knowledge of information technology is necessary.
 - (a) It must be avoided that all measures have the same vulnerability, even if it is unknown one.
- Corporation of Plant Engineers and Information ones are essential.

CAD for Zone dividing

- In some industrial plants, more than 1000 variables such as PV and MV of controllers are managed by one operator.
- There are huge number of options of zone dividing of controllers and sensors.
- The relationships among controllers and sensors can be expressed as DAE (Differential and Algebraic Equations).
- The equations are registered in CAD for Process Design

Development of CAD for Zone dividing

- CAD to generate Fault Tree for Zone Diving
- CAD for Zone Diving to detect operation under concealment

CAD to generate Fault Tree

Registration of Top part of Fault Trees for Equipment Modules

State variables of Reactor

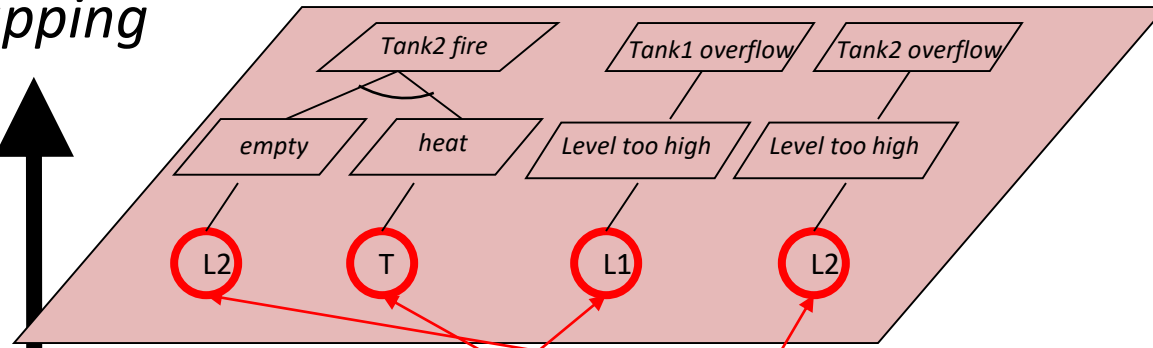

Causes of the **accident** might occur in the **other equipment**.

Propagation of the changes from Causes can be calculated by CAD.

Structure of Accidents caused by Cyber-Attacks

mapping

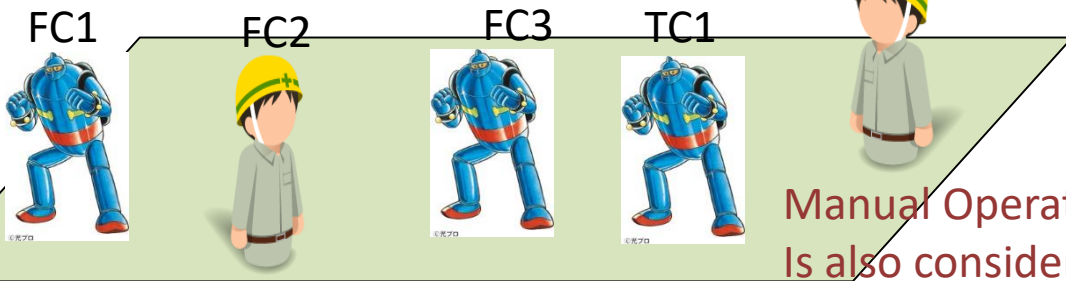

fault tree of safety

State to cause Accidents

cause-effect model

Propagation of State transition

Attacked controllers

Malicious Manipulation
And Concealment

Manual Operation

Is also considered as Controller Acton.

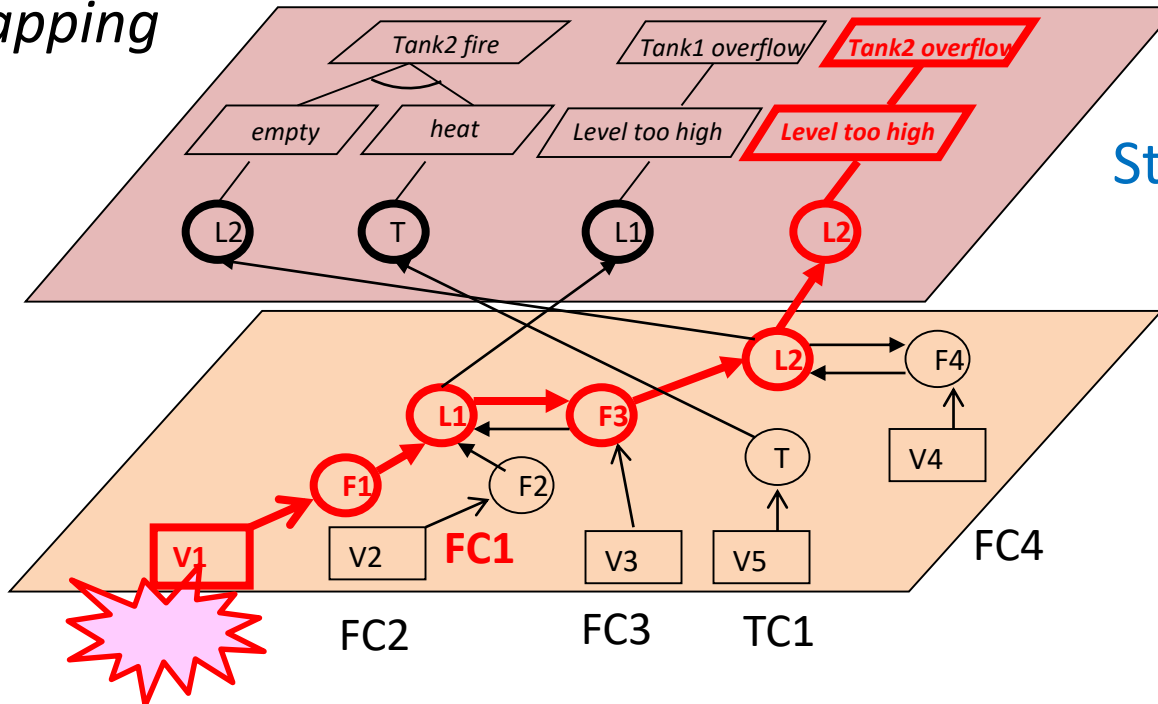

Operating or Attacking

Controller can be manipulated
To make plant unsafe.

Cause controller search according to the transition path

mapping

fault tree of safety

State to cause Accidents

cause-effect model

Propagation of State transition

The cause might occur in other plant far from the Accident

Approach to CAD

Register DAE (Differential Algebraic Equation) to each Equipment module. From the Combined Equations for the whole plant, qualitative model to calculate state transition is generated.

Application Example

e.g. Tank with Heater system

Differential Equation

$$\frac{dL_1}{dt} = \frac{F_a - F_b}{A_1}$$

$$\frac{dT_1}{dt} = \frac{F_a * (T_a - T_1) + H}{A_1 * L_1}$$

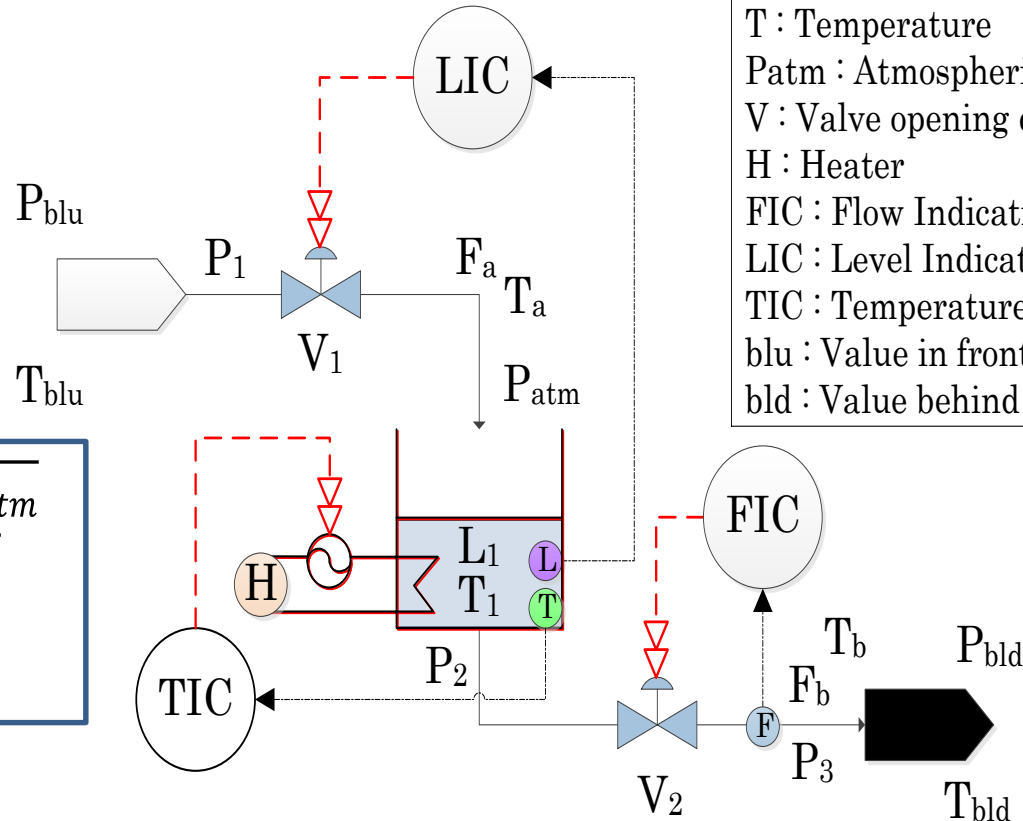

Algebraic Equation

$$0 = F_a - k_1 * V_1 * \sqrt{P_1 - P_{atm}}$$

$$0 = F_b - k_2 * V_2 * \sqrt{P_2 - P_3}$$

$$0 = P_2 - (P_{atm} + \alpha * L_1)$$

$$0 = T_1 - T_b$$

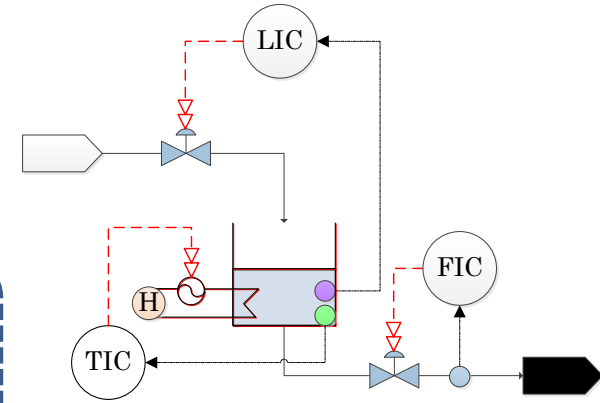

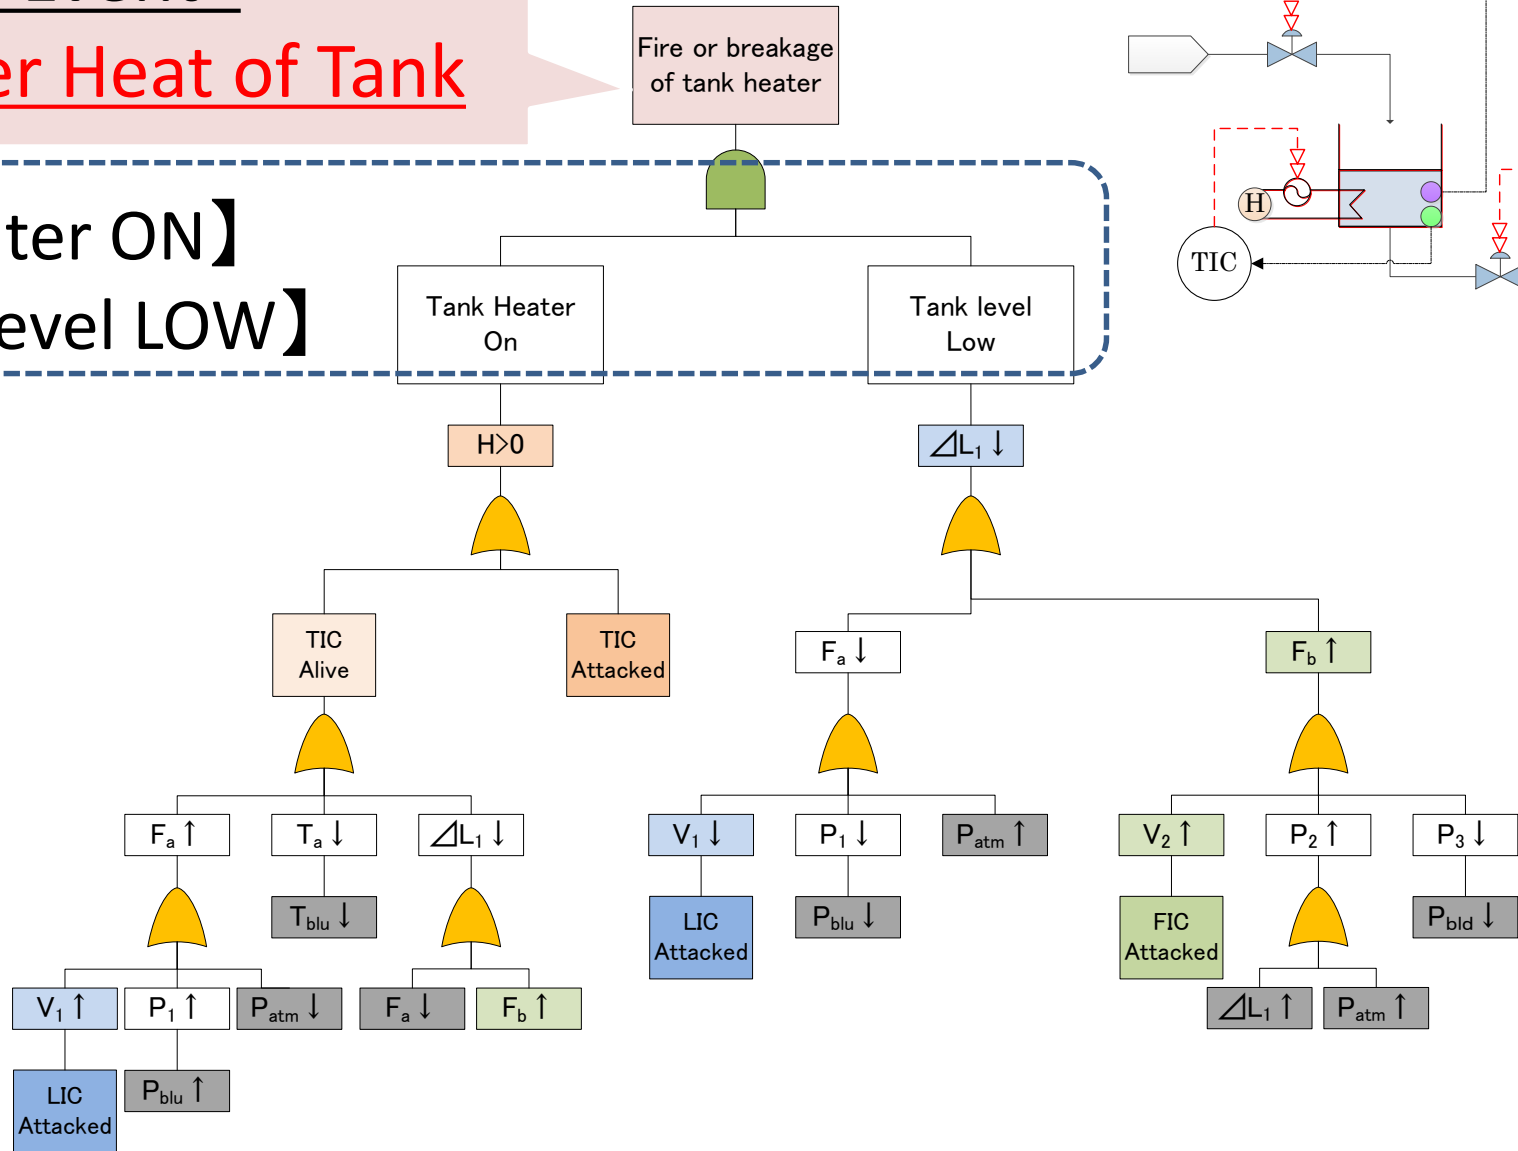

F : Flow rate
 P : Pressure
 L : Tank's level
 T : Temperature
 Patm : Atmospheric pressure
 V : Valve opening degree
 H : Heater
 FIC : Flow Indication Controller
 LIC : Level Indication Controller
 TIC : Temperature Indication Controller
 blu : Value in front of System
 bld : Value behind System

- ii .LIC Fail

Expansion of Fault Tree in searching Controller Failures

Cyber-Security Measures based on Fault Tree

Find the Pair of Controllers of AND conditions in Fault Tree.

To maintain Safety against Cyber-Attacks

- Protect the Controllers in AND conditions using Cyber-Security Measures

Not to be defeated **Simultaneously**.

(Approach 1)

The Controllers should be contained in different network zones
And the zones should be protected with different security tools.

(Approach 2)

Controllers should be improved to deny Unsafe commands
from Cyber-Attackers.

CAD for Zone Dividing to Detect Operation under Concealment

- By crucifixion the module, and to set up a connection, it is possible to design Zone Division

1. Drop module icons onto the page.

2. Connect the module icons and draw control loops.

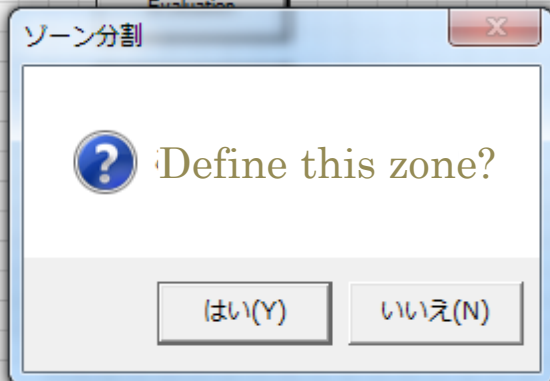

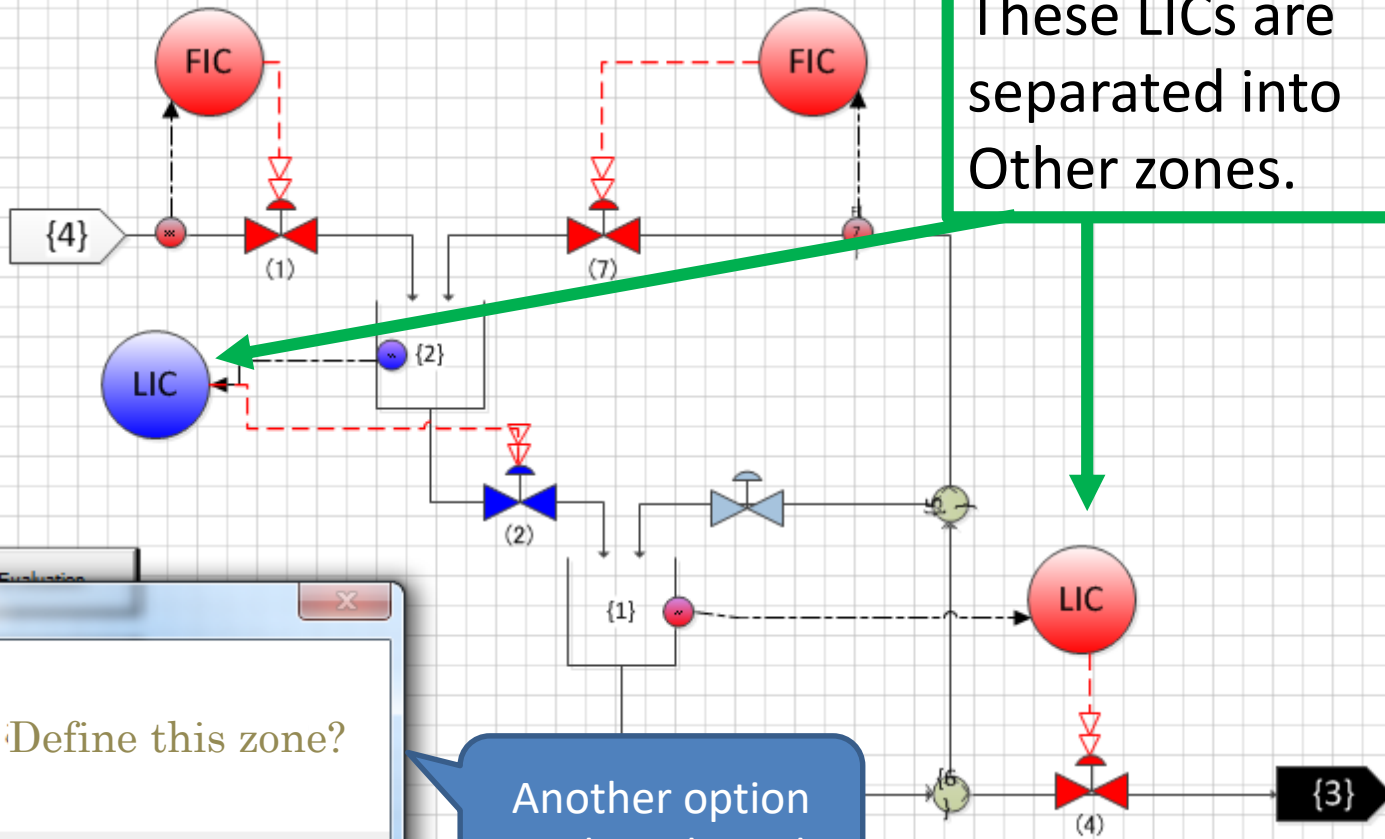

3. Click Suggestion button!

PVs in survival zones

Detectability of Cyber-Attacks

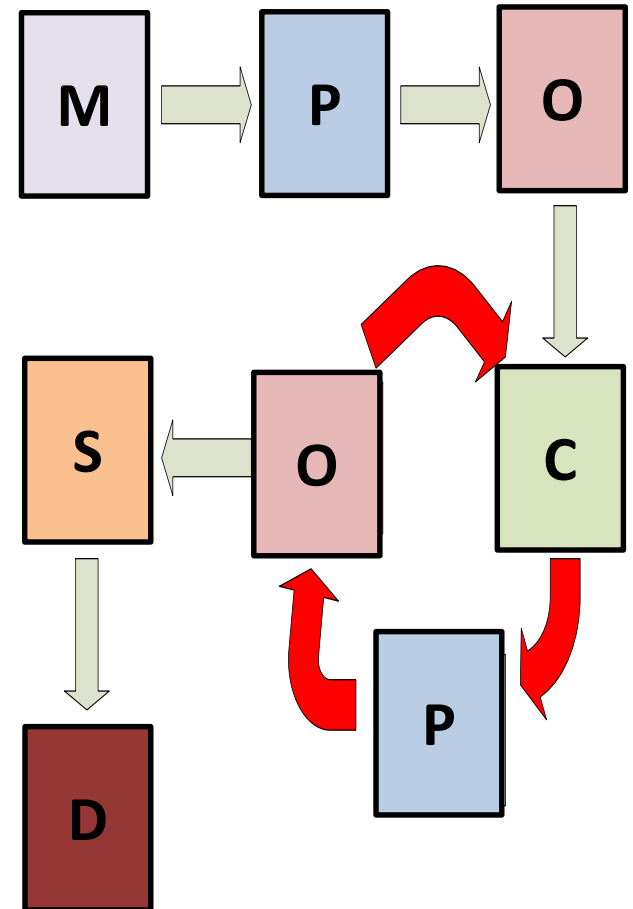

When Zone division is assumed,
C, O, M and S matrices can be generated.

The detectability of remote-operation under concealment by cyber-attackers can be calculated as follows.

➤ Detectability Matrix

$$D(m) = \sum_{k=1}^m S * (O * P * C)^{k-1} * O * P * M$$

The columns are remote-manipulation
in intruded zones and
the rows are observation in survival zones.

Detectability changes according to Zone Division

➤ The elements show the Detectability of Cyber-attacks in the zones.

- If L1{1} and L1{2} is the same zone, it can not be detected.

| Dam | | 1 | | |
|-----|---------|------|------|------|
| | | V(2) | V(4) | V(7) |
| 2 | F1(1) i | 0 | 0 | 0 |
| 2 | V(1) i | 0 | 0 | 0 |
| 2 | W(3) i | 0 | 0 | 0 |

Undetectable

| Dbm | | 2 | |
|-----|---------|------|------|
| | | V(1) | W(3) |
| 1 | L1{2} i | 2 | 0 |
| 1 | L1{1} i | 0 | 2 |
| 1 | F(7) i | 0 | 2 |
| 1 | V(2) i | 0 | 0 |
| 1 | V(4) i | 0 | 2 |
| 1 | V(7) i | 0 | 2 |

- If L1{1} and L1{2} is a separate zone, it can be detected.

| Dam | | 1 | | |
|-----|---------|------|------|------|
| | | V(1) | V(2) | V(7) |
| 2 | L1{1} i | 3 | 2 | 2 |
| 2 | W(3) i | 0 | 0 | 0 |
| 2 | V(4) i | 0 | 2 | 3 |

| Dbm | | 2 | |
|-----|---------|------|------|
| | | W(3) | V(4) |
| 1 | L1{2} i | 0 | 0 |
| 1 | F(1) i | 0 | 0 |
| 1 | F(7) i | 1 | 1 |
| 1 | V(1) i | 0 | 0 |
| 1 | V(2) i | 0 | 0 |
| 1 | V(7) i | 0 | 0 |

CAD generates many options of zone diving and checks detectability automatically. Zone dividing to detect cyber-attack is selected from the options.

How should Security Measures be proposed?

**It is not necessary to explain the necessity.
Please propose adequate cyber-security measures for our plants.**

If the measures would be expensive, my boss would complain "There are many risks besides cyber-security!"

**Wonderful!
Let's do it!**

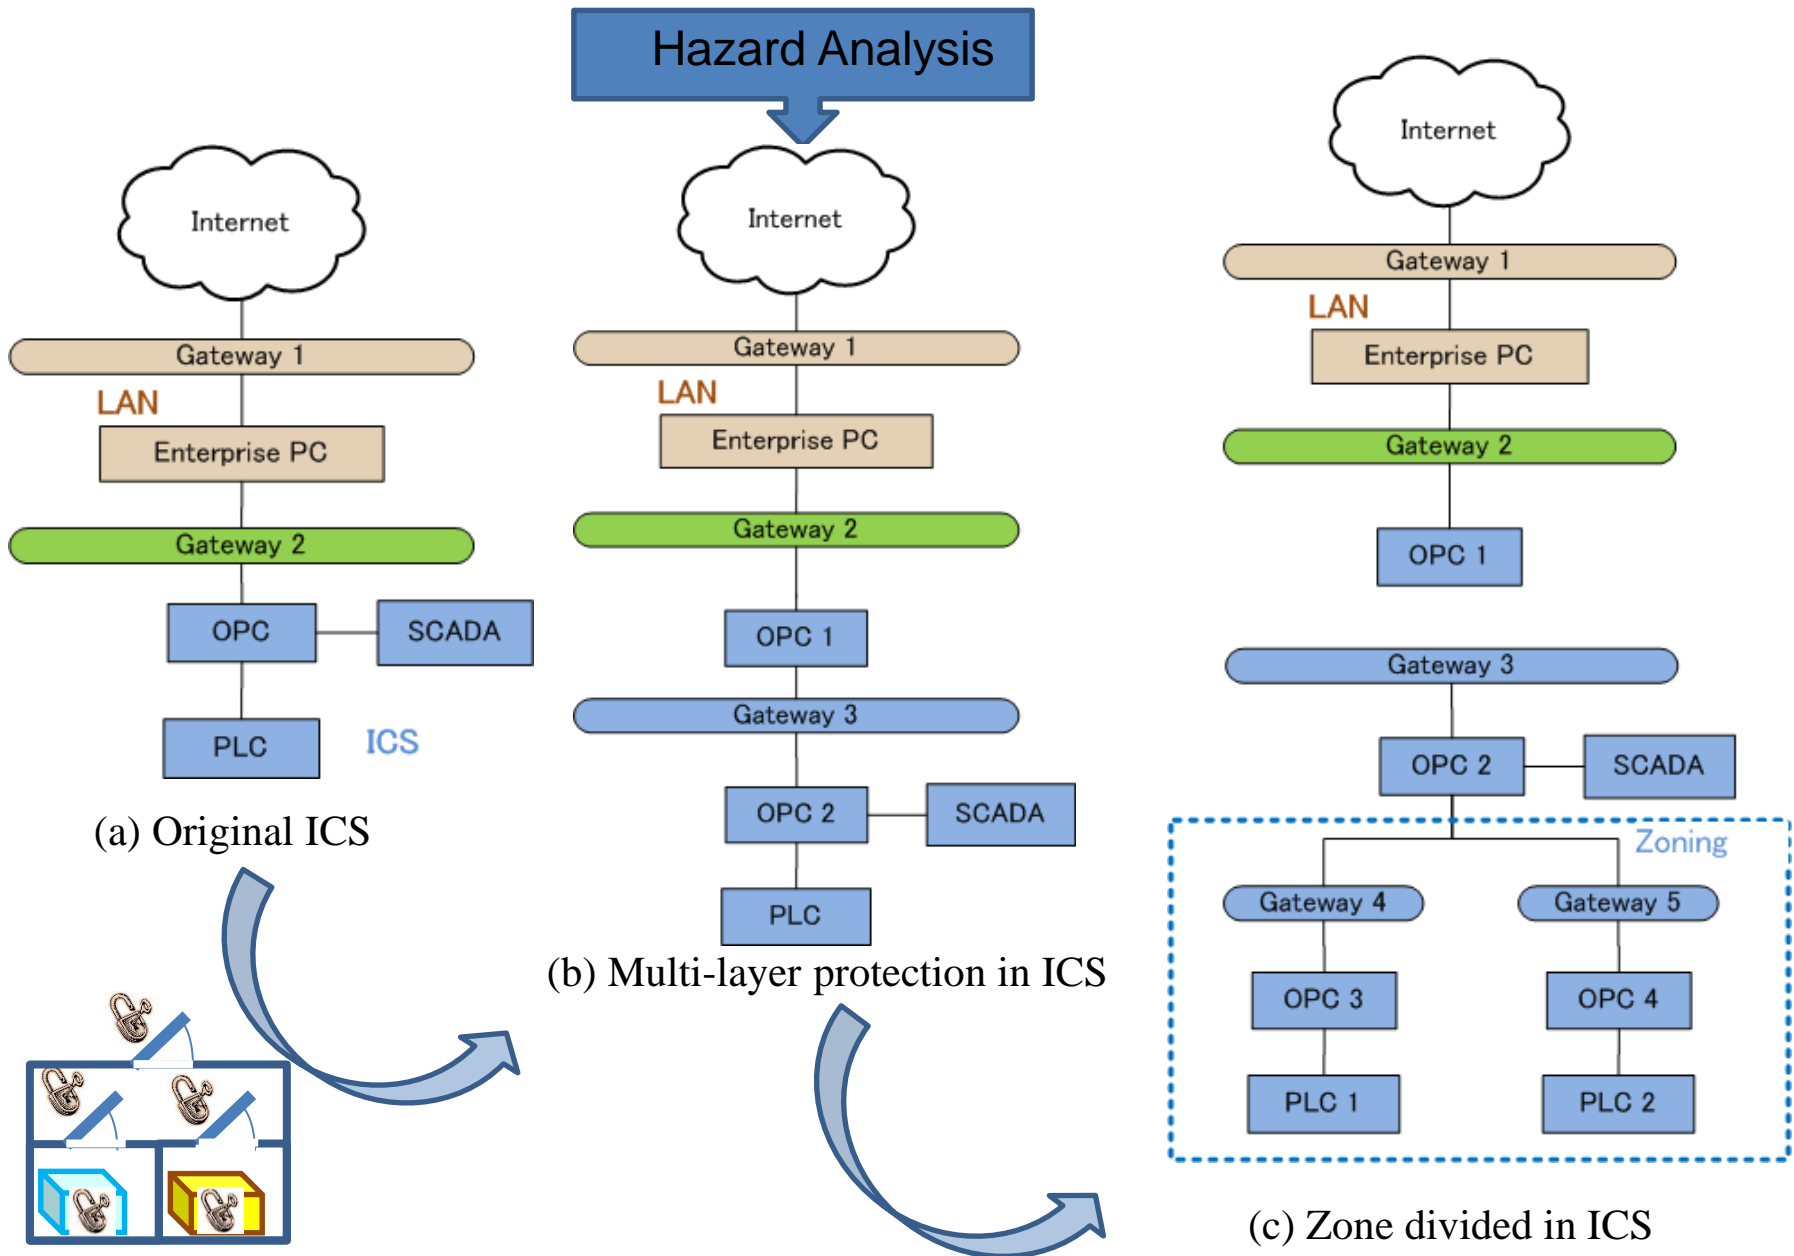

**I want to say it.
But, what information should I get to say so?**

**I want to hear it.
But, what information should I give to hear it?**

Design Approach of Cyber-Security Systems

1. **Fault Tree** Analysis for Zone Diving
2. **Attack Route** Analysis to Essential Controllers
3. Select Security tools to satisfy the required SAL using **SAL Assessment Table** for each attack route
4. Make **Scenarios** of Incidents or Accidents based on the Alarm of detection systems
5. Plan the **Operators' actions** to maintain safety at the hypothetical incidents
6. Return to Stage 3 until Cost and Effects of measures are **compromised**.

Protection I: Configuration Design for Safety Improvement

Analysis Based on Intrusion Pathways

Intrusion from internet

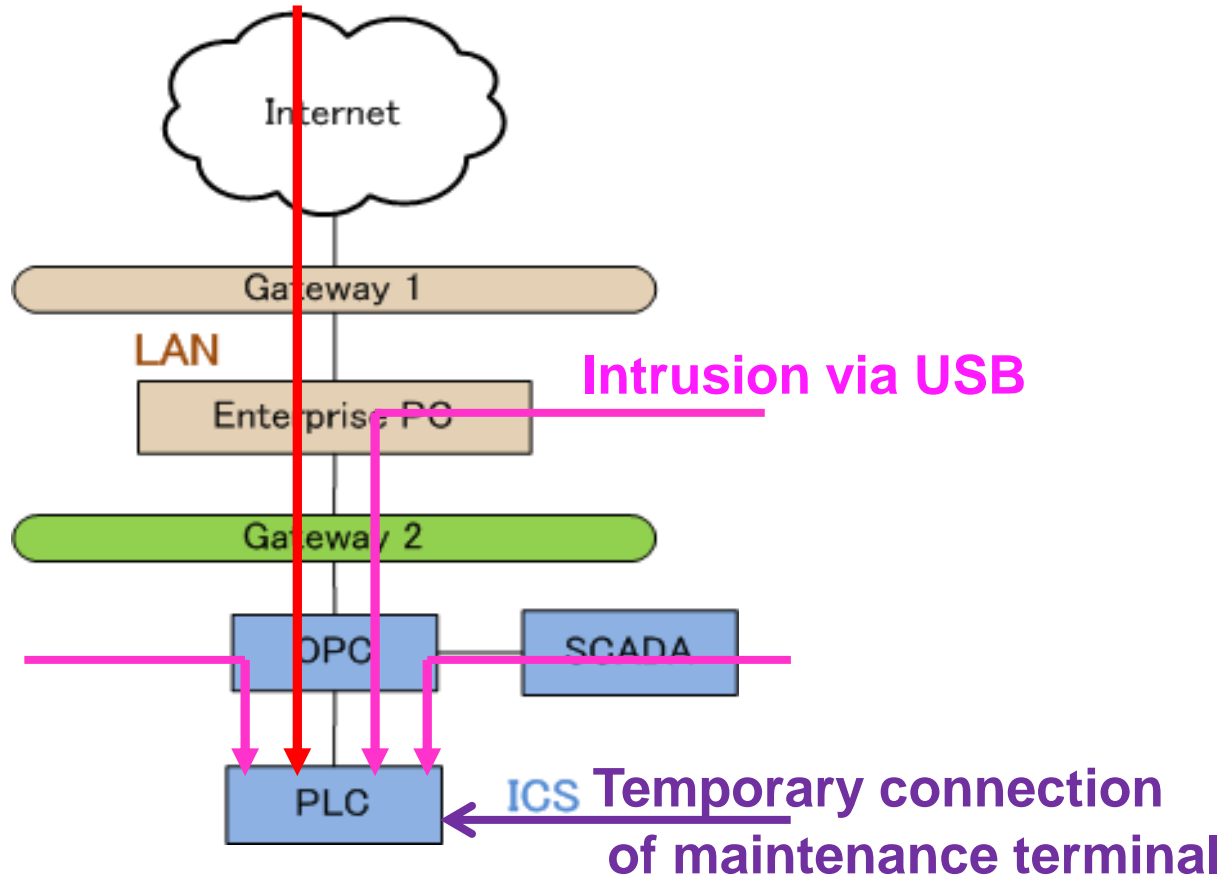

Fig. 3 Intrusion pathways in Original ICS

All pathways must be secure for SCI security

Protection II: Selecting Measures Against Cyber-attacks in ICS

In this research, the 7 foundational requirements has been utilized [6]. They are defined in ISA 99. 01. 01, which is the standard to evaluate the cyber-security of ICS.

FR (Foundational Requirements)

- Access control (AC)
- Use control (UC)
- Data Integrity (DI)
- Data confidentiality (DC)
- Restrict data flow (RDF)
- Timely response to an event (TRE)
- Resource availability (RA)

Requirements for SAL(Security Assurance Level)

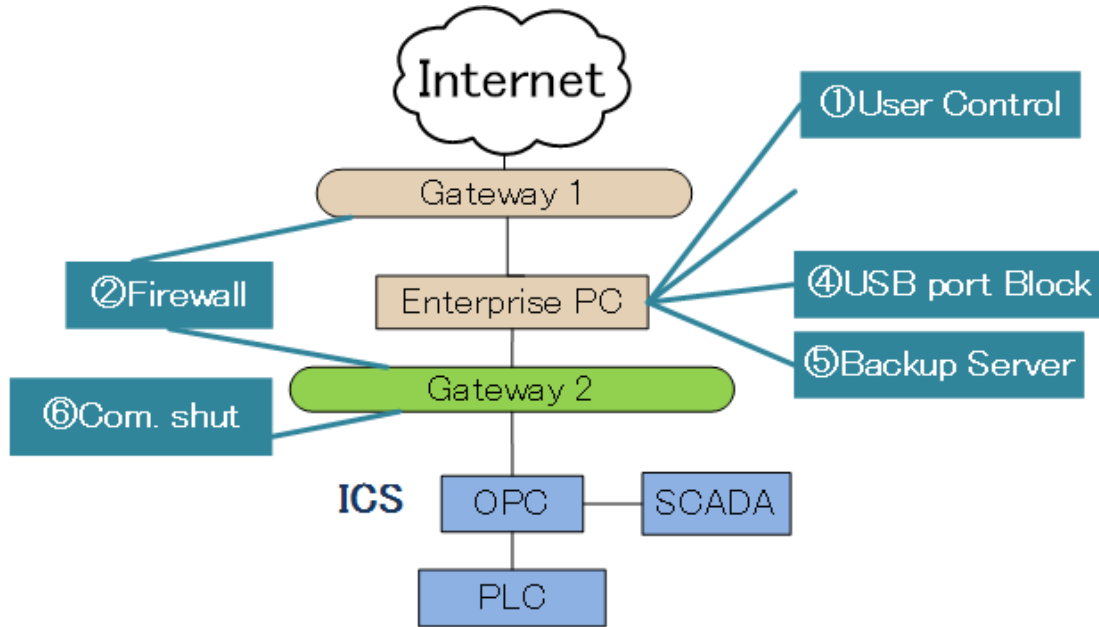

- SAL1: Protection against casual or coincidental violation
- SAL2: Protection against intentional violation using simple means
- SAL3: Protection against intentional violation using sophisticated means
- SAL4: Protection against intentional violation using sophisticated means with extended resources

- (AC) Access control
- (UC) Use control
- (DI) Data integrity
- (DC) Data confidentiality
- (RDF) Restrict data flow
- (TRF) Timely response to an event
- (RA) , Resource availability(RA)

| SAL | | AC-SAL | SAL | RDF-SAL |
|-----|---|--------|-----|---|
| 1 | Identify and authenticate IACS users by mechanisms which protect against casual or coincidental access by unauthorized entities. | | 1 | Prevent the casual or coincidental circumvention of zone and conduit segmentation systems. |
| 2 | Identify and authenticate IACS users by mechanisms which protect against intentional unauthorized access by entities using simple means. | | 2 | Prevent the intended circumvention of zone and conduit segmentation systems by entities using simple means. |
| 3 | Identify and authenticate IACS users by mechanisms which protect against intentional unauthorized access by entities using sophisticated means. | | 3 | Prevent the intended circumvention of zone and conduit segmentation systems by entities using sophisticated means. |
| 4 | Identify and authenticate IACS users by mechanisms which protect against intentional unauthorized access by entities using sophisticated means with extended resources. | | 4 | Prevent the intended circumvention of zone and conduit segmentation systems by entities using sophisticated means with extended resources. |
| SAL | | UC-SAL | SAL | TRE-SAL |
| 1 | Restrict use of the system or assets according to specified privileges to protect against casual or coincidental misuse. | | 1 | Monitor the operation of the system and respond to incidents when they are discovered by providing the forensic evidence when queried. |
| 2 | Restrict use of the system or assets according to specified privileges to protect against circumvention by entities using simple means. | | 2 | Monitor the operation of the system and respond to incidents when they are discovered by actively collecting forensic evidence from the system. |
| 3 | Restrict use of the system or assets according to specified privileges to protect against circumvention by entities using sophisticated means. | | 3 | Monitor the operation of the system and respond to incidents when they are discovered by actively pushing forensic evidence to the proper authority. |
| 4 | Restrict use of the system or assets according to specified privileges to protect against circumvention by entities using sophisticated means with extended resources. | | 4 | Monitor the operation of the system and respond to incidents when they are discovered by actively pushing forensic evidence to the proper authority in near real-time. |
| SAL | | DI-SAL | SAL | RA-SAL |
| 1 | Protect the integrity of information in the system against casual or coincidental manipulation. | | 1 | Ensure that the system operates reliably under normal production conditions and prevents denial-of-service situations caused by the casual or coincidental actions of an entity. |
| 2 | Protect the integrity of information in the system against manipulation by someone using simple means. | | 2 | Ensure that the system operates reliably under normal and abnormal production conditions and prevents denial-of-service situations by entities using simple means. |
| 3 | Protect the integrity of information in the system against manipulation by someone using sophisticated means. | | 3 | Ensure that the system operates reliably under normal, abnormal, and extreme production conditions and prevents denial-of-service situations by entities using sophisticated means. |
| 4 | Protect the integrity of information in the system against manipulation by someone using sophisticated means with extended resources. | | 4 | Ensure that the system operates reliably under normal, abnormal, and extreme production conditions and prevents denial-of-service situations by entities using sophisticated means with extended resources. |
| SAL | | DC-SAL | | |
| 1 | Prevent the dissemination of information via eavesdropping or casual exposure. | | | |
| 2 | Prevent the dissemination of information to an entity actively searching for it using simple means. | | | |
| 3 | Prevent the dissemination of information to an entity actively searching for it using sophisticated means. | | | |
| 4 | Prevent the dissemination of information to an entity actively searching for it using sophisticated means with extended resources. | | | |

Protection II: Selecting Measures Against Cyber-attacks in ICS

Because any tools are not almighty, combination of measures is necessary.

Type of Tools and Location must be selected.

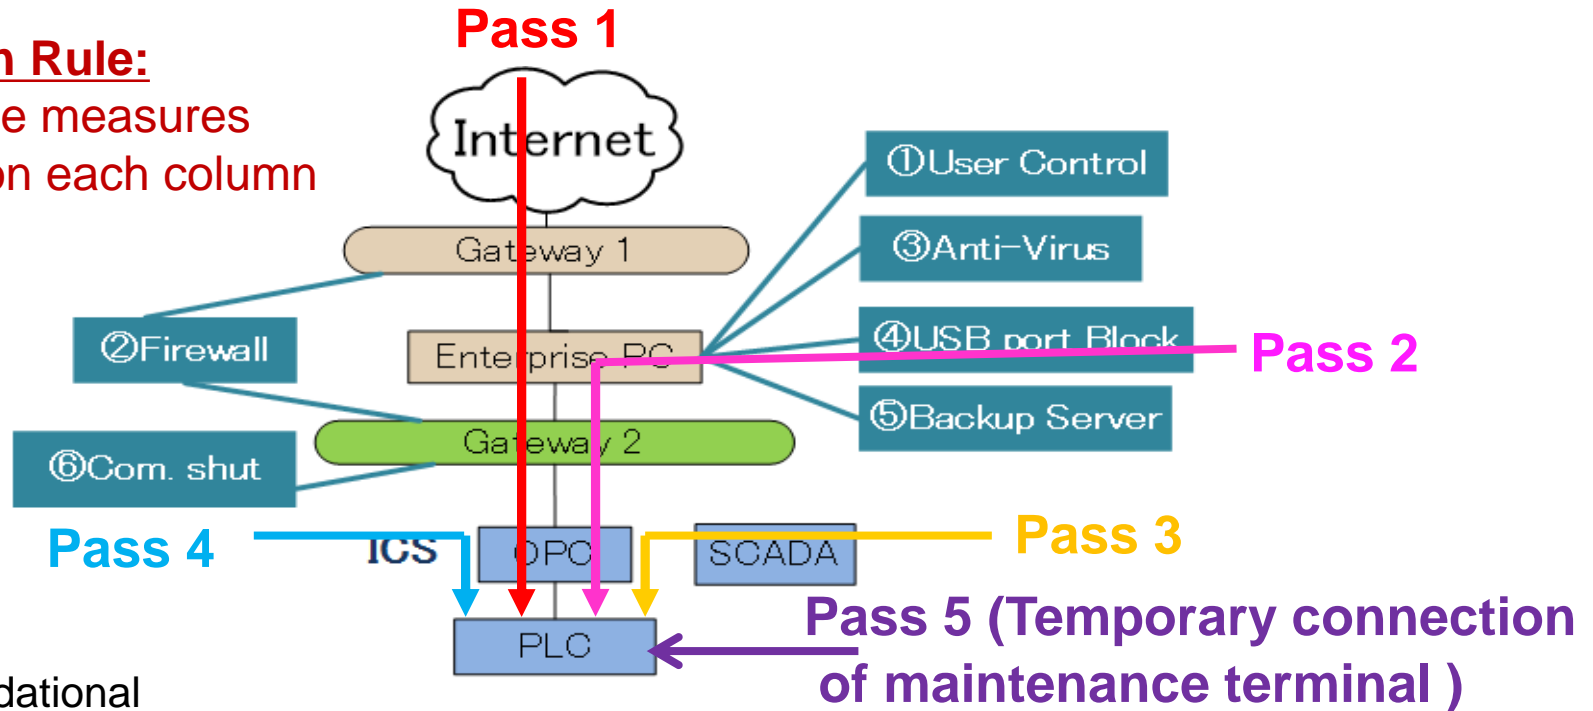

The evaluation of security tools based on foundational requirements

| | AC-SAL | UC-SAL | DI-SAL | DC-SAL | RDF-SAL | TRE-SAL | RA-SAL |
|------------------|--------|--------|--------|--------|---------|---------|--------|
| ① User Control | ○ | ○ | | ○ | | | |
| ② Firewall | | | ○ | ○ | ○ | | |
| ③ Anti-Virus | | | ○ | ○ | | ○ | |
| ④ USB port Block | | | ○ | ○ | | | |
| ⑤ Backup Server | | | | | | ○ | ○ |
| ⑥ Com. shut | | | ○ | ○ | ○ | | |

Protection II: Selecting Measures Against Cyber-attacks in ICS

Evaluation Rule:

At least one measures must exit on each column (ISA99).

Foundational requirements

Table 2 Measures setting by intrusion pathways analysis the case of Fig. 3

| Intrusion Pathways | AC-SAL | UC-SAL | DI-SAL | DC-SAL | RDF-SAL | TRE-SAL | RA-SAL |
|--------------------|--------|--------|--------|---------|---------|---------|--------|
| Gateway 1 | | | ② | ② | ② | | |
| Enterprise PC | ① (④) | ① | ③, ④ | ①, ③, ④ | | ③, ⑤ | ⑤ |
| Gateway 2 | | | ②, ⑥ | ②, ⑥ | ②, ⑥ | | |
| OPC | | | | | | | |
| SCADA | | | | | | | |
| PLC | | | | | | | |

In this case, all FRs are met, however, because there are no cyber-security measures in ICS, the plant is danger if cyber-attacks from OPC.

Protection II: Selecting Measures Against Cyber-attacks in ICS

The Case of Measures Selection for ICS (i): PLC Safety with Lowest Cost

Table 2 No cyber-security measures in ICS

| | AC | UC | DI | DC | RDF | TRE | RA |
|-------|----|----|----|----|-----|-----|----|
| SCADA | | | | | | | |
| OPC | | | | | | | |
| PLC | | | | | | | |

Considering the commonality of intrusion pathways, measures are selected from PLC.

| | AC | UC | DI | DC | RDF | TRE | RA |
|-------|----|----|----|----|-----|-----|----|
| SCADA | | | | | | | |
| OPC | | | | | | | |
| PLC | ① | ① | | ① | | | ⑤ |

Because the measure applying to PLC is limited, to meet all of the FR, the tools 3 and 6 are set on OPC

| | AC | UC | DI | DC | RDF | TRE | RA |
|-------|----|----|-----|-----|-----|-----|----|
| SCADA | | | | | | | |
| OPC | | | ③ ⑥ | ③ ⑥ | ⑥ | ③ | |
| PLC | ① | ① | | ① | | | ⑤ |

Fig. 3 Intrusion pathways

Protection II: Measures Against Cyber-attacks in ICS

The Case of Measures Selection for ICS (ii): Suppressing the Damage of Cyber-attacks by Early Detection

Table 2 No cyber-security measures in ICS

| | AC | UC | DI | DC | RDF | TRE | RA |
|-------|----|----|----|----|-----|-----|----|
| SCADA | | | | | | | |
| OPC | | | | | | | |
| PLC | | | | | | | |

For early detection, measures are set from entrance (SCADA).

| | AC | UC | DI | DC | RDF | TRE | RA |
|-------|----|----|----|-----|-----|-----|----|
| SCADA | ① | ① | ④ | ① ④ | | | |
| OPC | | | | | | | |
| PLC | | | | | | | |

Because the measure applying to SCADA is limited, to meet all of the FR, the tools 3, 6 and 5 are set on OPC

| | AC | UC | DI | DC | RDF | TRE | RA |
|-------|----|----|-----|-----|-----|-----|----|
| SCADA | ① | ① | ④ | ① ④ | | | |
| OPC | | | ③ ⑥ | ③ ⑥ | ⑥ | ③ | ⑤ |
| PLC | | | | | | | |

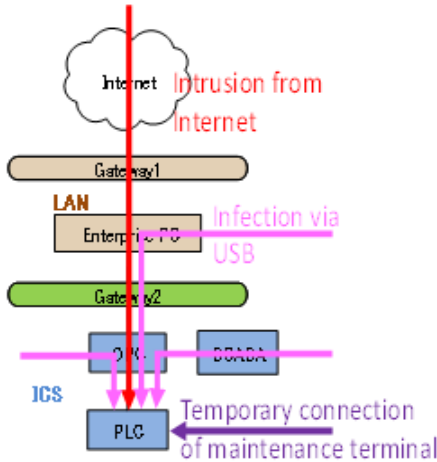

Fig. 3 Intrusion pathways

Protection III: Heterogeneity of Security Tools for Unknown Vulnerability

Even though plural tools were applied, they might be unavailable at once if they are homogenous.

Table 2 Measures setting by intrusion pathways analysis the case of Fig. 3

| | AC | UC | DI | DC | RDF | TRE | RA |
|---------------|----|----|------|---------|------|------|----|
| Gateway 1 | | | ② | ② | ② | | |
| Enterprise PC | ① | ① | ③, ④ | ①, ③, ④ | | ③, ⑤ | ⑤ |
| Gateway 2 | | | ②, ⑥ | ②, ⑥ | ②, ⑥ | | |
| OPC | | | | | | | |
| SCADA | | | | | | | |
| PLC | | | | | | | |

Heterogeneity is important for multi-layer security protection.

Table 5. Heterogeneity check of tools on Pathways of Table 2

| | Firewall | DataExchangeProtocol | OS | NetDevice | FileExchange |
|---------------|------------|----------------------|-------------|-----------|--------------|
| Gateway 1 | CISCO | OSI-PI | CISCO | CISCO | SMB |
| Enterprise PC | McAfee | OSI-PI, OPC-2.0 | Windows 7 | Aried | SMB |
| Gateway 2 | Linux | OPC-2.0 | CENT-OS | Catalyst | |
| OPC | Windows | Profi-net, OPC-2.0 | Windows XP | Intel | |
| SCADA | TrendMicro | OPC-2.0 | Server 2008 | Intel | |
| PLC | | Profi-net | | Siemens | |

Toward Spread of Security Measures

- A systematic approach to design robust protection systems against cyber-attacks for ICS is necessary.
- Measure selection table for cyber-security can visualize the performance of measures.
The types of tools and the location to apply them to can be discussed easily.

The cyber-security measures should be discussed considering possible hazards and budgets.

The measures selection tables are very helpful to the discussion between planners and managers.

戦略的イノベーション創造プログラム
Cross-ministerial Strategic Innovation Promotion Program

Pioneering the Future: Japanese Science, Technology and Innovation

One of 11 projects in SIP is “Cyber-Security for Critical Infrastructure”

2015～2019 Budget for 2016 : 2.5billion Yen

●Implementation Structure

Incident Response

- Make Scenarios based on the Alarm of Measures (Intrusion Detection System, Anti-Virus, Honeypot,...)
- Plant Operators' Action to maintain Safety.

(Scenario 1) Accident occurred without Alarms.

(Scenario 1') IDS alarm was detected.

(Scenario 1'') Mal-Operation was executed after IDS alarm.

(Scenario 2) Mal-Operation was executed by Malware without Alarms.

(Scenario 2') Malware was detected by Anti-Virus.

How can you estimate the Risk of Serious Accidents?

How can you manage the urgent situation?

How can you maintain safety under the attacked situation?

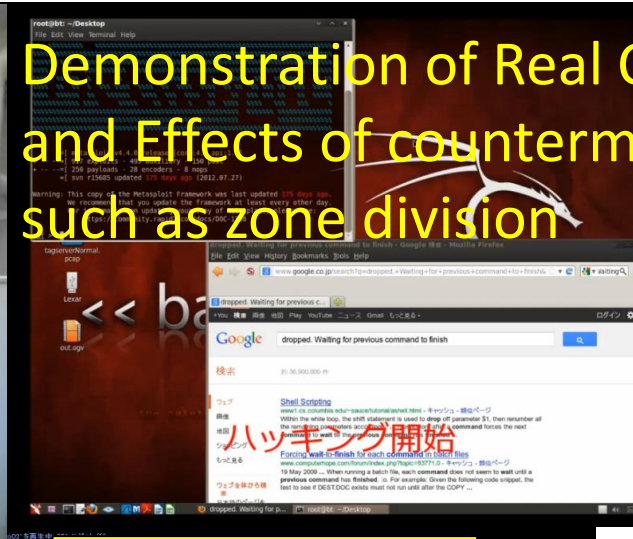

Necessity of Security tools to manage the urgent situation must be imaged.

ICS Security Workshop in Nagoya Inst. Tech. (1)

- (1st) March 19,20 in 2015 18 participants from 13 companies
- (2nd) August 26,27 in 2015 74 participants from 30 companies
- (3rd) March 26,27 in 2016 47 participants from 26 companies
- (4th) September 27 in 2016 54 participants from 32 companies

Demonstration of Real Cyber Attacks and Effects of countermeasures such as zone division

Dividing Control Network into Zones

Number of visitors was more than 400 in April 2016

ICS Security Workshop in Nagoya Inst. Tech. (2)

Security-II (Cyber Security corresponding to Safety-II)

Focusing not only Safety but also BCP/BCM,
training for collaboration in the whole organization (divisions for plant
operation, asset, information, sales, management and so on) and outers
to measure the cyber-attacks is proposed.

The scenarios are cyber attacks to an energy service company.

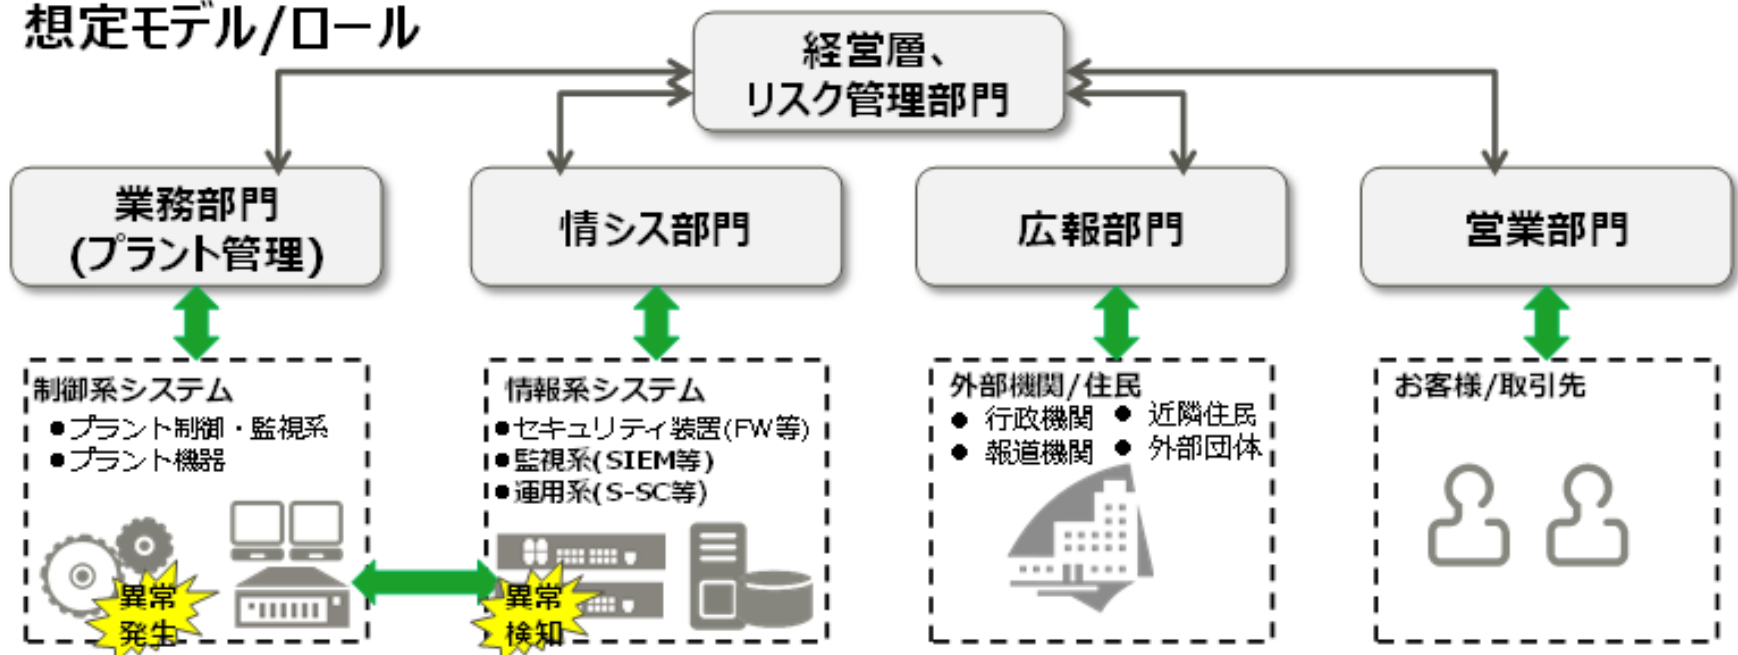

to prevent the diffusion of the damage
and for prompt recovery.

ICS Security Workshop in Nagoya Inst. Tech. (3)

Group discussion is executed by the participants of the workshop from detection and recovery.

2012

- 1) Conceptual Framework for Security Hazard Management in Critical Infrastructures, Y. Hashimoto, T. Toyoshima, S. Yogo, M. Koike, S. Jing, I. Koshijima, The 11th International Symposium on Process Systems Engineering, CDROM (2012)
- 2) A Method of Designing Plant Alarm Systems with Hierarchical Cause-Effect Model, T.Hamaguchi, K.Takeda, M.Noda, N.Kimura, Proc. PSE 2012, pp. 265-269 (2012)
- 3) サステナブルP2Mへの展開 –プラント-プロダクトLCMとしてのプログラムマネジメント–,西田絢子, 越島一郎, 梅田富雄, 国際プロジェクト・プログラムマネジメント学会誌, Vol.6, No.2, pp.165-175 (2012)

~2011

- 1) サイバーテロを想定した場合のリスク解析と対策の構築, 豊嶋剛史, 孫晶, 越島一郎, 橋本芳宏, J. of Human Factors in Japan, Vol.15, No.2, pp.4-9 (2011)
- 2) ミッションマネジメントのためのコンセプト設計と管理に関する基本的考察, 濱田和弥, 村田裕樹, 越島一郎, 国際プロジェクト・プログラム学会誌, Vol.5, No.2, pp.137-149 (2011)
- 3) Design Method of Plant Alarm Systems on the Basis of Two-Layer Cause-Effect Model, K.Takeda, A.H.B.M.Aimi, T.Hamaguchi, M.Noda, LNAI 6883, pp. 415-422 (2011)
- 4) An Evaluation Method for Plant Alarm System Based on a Two-Layer Cause-Effect Model, N.Kimura, K.Takeda, M.Noda, T.Hamaguchi, Proc. ESCAPE-21, pp. 1065-1069 (2011)
- 5) Consistency Checking Method of Inventory Control for Countermeasures Planning System, T. Hamaguchi, K. Takeda, H. Matsumoto, Y. Hashimoto, LNAI 6277, pp.417-426 (2010)
- 6) Integration of Multi-agent Controller and Scheduler for Multi-purpose and Multi-batch Plant, T. Hamaguchi, M. Inoue, T. Yoshida, K. Kawano, H. A. Gabbar, K. Takeda, Y. Shimada, T. Kitazima, Y. Hashimoto, KES 2007 Part II, pp.736-743(2007)
- 7) Agent-Based Batch Process Control Systems, M. Sakamoto, H. Eguchi, T. Hamaguchi, Y. Ota, Y. Hashimoto, T. Itoh, KES2004 Part II, (2004)
- 8) Abnormal situation correction based on controller reconfiguration, T. Hamaguchi, Y. Hashimoto, T. Itoh, A. Yoneya, Y. Togari, Journal of Process Control, Vol.13, No.2, pp.169-175 (2003)
- 9) An Approach to Potential Risk Analysis of Networked Chemical Plants, A.Shindo, H. Yamazaki, A. Toki, I. Koshijima, T. Umeda, PSE 2000, (2000)
